Crypto libraries introduction

Milan Brož xbroz@fi.muni.cz

Crypto libraries... plan for next two PV181 labs

- Linux environment
 - Fedora in VirtualBox (image in IS) or
 - aisa.fi.muni.cz (OpenSSL only)
- Examples in C language
- 1st lab: Intro, crypto primitives examples
- 2nd lab: symmetric ciphers, asymmetric crypto, basic certificates
- Home assignments (max. 10 point each)

Lab environment VirtualBox image

- Unpack zip archive from IS
- Open VirtualBox (click blue icon config file)
 D:\PV181 is shared between host and VM
- Login and password is "pv181" (same for sudo and root password)
- Clone examples from FI gitlab: git clone https://gitlab.fi.muni.cz/xbroz/pv181.git (or use script in home dir in VM) make clean; make; ./example
- OpenSSL examples works also on aisa

Cryptographic libraries ... An Introduction

- opensource / proprietary
- static + embedded / dynamically linked
- low / high level abstractions
- multiplatform
- stable API/ABI
- specific implementations
 - side-channel resistance
 - HW acceleration support
 - ...

Open-source crypto libraries examples

- Nettle
- gcrypt
- OpenSSL (and derivates)
- NSS
 - Network Security Services (Mozilla)

. . .

NaCl ("salt") -> libsodium

ABSTRACTION high

Crypto libraries

- Random Number Generator (RNG) access
- Hash, keyed-hash (HMAC, msg authentication)
- Symmetric ciphers and modes
- Asymmetric ciphers
- Certificate support, ASN.1, ...
- Key exchange, key derivation
- Helpers
 - secure memory
 - safe comparison
 - network / sockets
 - ...

Today's exercise

- Low-level crypto primitives
 - RNG
 - Hash, HMAC
 - PBKDF

 Examples comparison in OpenSSL, gcrypt, libsodium

Defensive approach:
 It will fail, be prepared for it. ☺

Why implementation matters Key from Linux RNG example

Bad coding: How many bugs do you see?

```
#include <string.h>
#include <unistd.h>
#include <fcntl.h>
int main(int argc, char *argv[])
{
   int fd;
   char key[32];
   fd = open("/dev/random", 0 RDONLY);
   read(fd, key, 32);
   close(fd);
   // Do something with the key[]
   memset(key, 0, sizeof(key));
   return 0;
```

Example 1: RNG in libraries

libgcrypt

```
see 1_rng_gcrypt example (void) gcry_randomize(buf, sizeof(buf), GCRY_STRONG_RANDOM);
```

OpenSSL

```
see 1_rng_openssI example (int) RAND_bytes(buf, sizeof(buf))
```

libsodium

```
see 1_rng_sodium example (void) randombytes(buf, sizeof(buf));
```

Simple? Not in real-world. RNG or pseudo RNG, optional parameters, initialization or another call for configuration, can/cannot fail, can/cannot block if not enough entropy, is it own implementation or wrapper to system RNG, can it be used in FIPS mode ...

Example 2: Hash functions

libgcrypt

```
See 2_hash_hmac_gcrypt example
gcry_md_open(context, hash_id, flags)
gcry_md_write(context, data, data_len)
gcry_md_read(context, hash_id)
gcry_md_close(context)

OpenSSL (new 1.1.0 syntax)

EVP (envelope) interface, see 2_hash_hmac_openssl example

EVP_MD_CTX_new();
EVP_DigestInit(context, hash_id)
EVP_DigestUpdate(context, data, data_len)
EVP_DigestFinal(context, out, &out_len)
EVP_MD_CTX_free(context);
```

libsodium

```
See 2_hash_hmac_sodium example
crypto_hash_sha256_init(context)
crypto_hash_sha256_update(context, data, data_len)
crypto_hash_sha256_final(context, out))
```

Example 2: HMAC

Keyed Hash Message Authentication Code

libgcrypt

```
See 2_hash_hmac_gcrypt example
gcry_md_open(context, hash_id, GCRY_MD_FLAG_HMAC)
gcry_md_setkey(context, key, key_len)
gcry_md_write(context, data, data_len)
gcry_md_read(context, hash_id)
gcry_md_close(context)
```

OpenSSL (new 1.1.0 syntax)

```
EVP interface or direct calls, see 2_hash_hmac_openssI example
```

```
HMAC_CTX_new();
HMAC_Init(context, key, key_len, hash_id)
HMAC_Update(context, data, data_len)
HMAC_Final(context, out, &out_len)
HMAC_CTX_free(context);
```

libsodium

```
NaCl compatible interface, see 2_hash_hmac_sodium example crypto_auth(out, data, data_len, key)) crypto_auth_verify(expected_out, data, data_len, key))
```

Example 3: PBKDF

Password-Based Key Derivation Functions

libgcrypt

See 3_pbkdf_gcrypt example

```
gcry_kdf_derive(password, password_len,
GCRY_KDF_PBKDF2, GCRY_MD_SHA256,
salt, salt_len, iterations, key_len, key)
```

OpenSSL

See 3_pbkdf_openssl example

```
PKCS5_PBKDF2_HMAC(password, password_len, salt, salt_len, iterations, EVP_sha256, key_len, key)
```

libsodium

(no example intentionally, default Argon2i is too recent :-)

```
crypto_pwhash(key, key_len, password, password_len, salt, opslimit, memlimit, algorithm)
```

Note: old API functions based on PBKDF2 (supports only time cost – iterations) For recent algorithms (scrypt, Argon2i) API calls are often abused ...

Assignment

- Goal is to
 - Work with standard (RFC) document
 - Use test vectors (self tests)
 - Use OpenSSL in Linux environment
- See Assignment.txt in IS
- You can start with the provided example
- Comment your code
 - but do not overuse comments
- NO plagiarism (even from previous years)
 - => 0 points for both sides (sender & receiver)
- Code quality matters!
